PROJECT NAME	

A Data Flow Diagram (DFD) is a graphical representation of the flow of data through a system, illustrating how information moves from input to output, including storage and processing points. It's a visual tool used to understand, analyze, and improve systems, particularly in software engineering and business process modeling.

Use

➢ DFDs show how data moves through a system, making it easier to understand data inputs, processes, and outputs.
➢ Used by system analysts and designers to model and analyze how a system processes data.
➢ Helps spot unnecessary data movements or redundant processes in a system.
➢ Used as part of system documentation for current or future reference and maintenance.
